

Abstract

The dimension in the height direction of a reel braking mechanism to be disposed on the side of S-side reel table is
5 made small while making it difficult to disassemble an assembled state.

The dimension in an axis line direction of a pin 63, which engages a long hole 65 of a brake member 64, of a brake arm 55 is lengthened, thereby penetrating the brake member
10 64 and extending downward, and the extended portion of the pin 63 is made to relief through a cut 70 of a slide chassis 33.
